

Product Overview

The NSi8120D0 devices are high reliability ultra small package dual-channel digital isolator. The NSi8120D0 device can support 2kVrms insulation withstand voltage while providing high electromagnetic immunity and low emissions at low power consumption. The data rate of the NSi8120D0 is up to 150Mbps, and the common-mode transient immunity (CMTI) is up to 200kV/us. The NSi8120D0 device provides the default output low level when the input power is lost. Wide supply voltage of the NSi8120D0 device support to connect with most digital interface directly, easy to do the level shift. High system level EMC performance enhance reliability and stability of use.

Key Features

- Up to 2000V_{RMS} Insulation voltage
- Creepage: 2mm
- Data rate: DC to 150Mbps
- Power supply voltage: 2.5V to 5.5V
- High CMTI: 200kV/us
- Chip level ESD: HBM: ±6kV
- High system level EMC performance:
- Enhanced system level ESD, EFT, Surge immunity
- Default output high level or low level option
- Low power consumption: 1mA/ch (1 Mbps)
- Low propagation delay: <10ns

Applications

- Industrial automation system
- Isolated SPI, RS232, RS485
- General-purpose multichannel isolation
- Motor control

7. Function Description

7.1. Overview

The NSi8120D0 is a Dual-channel digital isolator based on a capacitive isolation barrier technique. The digital signal is modulated with RF carrier generated by the internal oscillator at the Transmitter side. Then it is transferred through the capacitive isolation barrier and demodulated at the Receiver side.

The NSi8120 devices are high reliability dual-channel digital isolator with AEC-Q100 qualified. The NSi8120 device can support 2000Vrms insulation withstand voltage, while providing high electromagnetic immunity and low emissions at low power consumption. The data rate of the NSi8120 is up to 150Mbps, and the common-mode transient immunity (CMTI) is up to 200kV/us. The NSi8120 device provides the default output high level configuration when the input power is lost. Wide supply voltage of the NSi8120 device support to connect with most digital interface directly, easy to do the level shift. High system level EMC performance enhance reliability and stability of use.

The NSi8120 has a default output status when VDDIN is unready and VDDOUT is ready as shown in Table 7.1, which helps for diagnosis when power is missing at the transmitter side. The output B follows the same status with the input A within 20us after powering up.

Table 7.1 Output status vs. power status

Input	VDD1 status	VDD2 status	Output	Comment
H ¹	Ready	Ready	H	Normal operation.
L ²	Ready	Ready	L	
X ³	Unready	Ready	L H	The output follows the same status with the input within 60us after input side VDD1 is powered on.
X	Ready	Unready	X	The output follows the same status with the input within 20us after output side VDD2 is powered on.
Note: H=Logic high; L=Logic low; X=Logic low or logic high				

8. Application Note

8.1. PCB Layout

The NSi822x requires a 0.1 μF bypass capacitor between VDD1 and GND1, VDD2 and GND2. The capacitor should be placed as close as possible to the package. Figure 8.1 to Figure 8.2 show the recommended PCB layout, make sure the space under the chip should keep free from planes, traces, pads and via. To enhance the robustness of a design, the user may also include resistors (50–300 Ω) in series with the inputs and outputs if the system is excessively noisy. The series resistors also improve the system reliability such as latch-up immunity.

The typical output impedance of an isolator driver channel is approximately 50 Ω , $\pm 40\%$. When driving loads where transmission line effects will be a factor, output pins should be appropriately terminated with controlled impedance PCB traces.

Figure8.1 Recommended PCB Layout — Top Layer

Figure8.2 Recommended PCB Layout — Bottom Layer

8.2. High Speed Performance

Figure 8.3 shows the eye diagram of NSi822x at 200Mbps data rate output. The result shows a typical measurement on the NSi822x with 350ps p-p jitter.

Figure8.3 NSi822x Eye Diagram

8.3. Typical Supply Current Equations

The typical supply current of NSi822x can be calculated using below equations. I_{DD1} and I_{DD2} are typical supply currents measured in mA, f is data rate measured in Mbps, C_L is the capacitive load measured in pF

NSi8220:

$$I_{DD1} = 0.19 * a1 + 1.45 * b1 + 0.82 * c1.$$

$$I_{DD2} = 1.36 + VDD1 * f * C_L * c1 * 10^{-9}$$

When $a1$ is the channel number of low input at side 1, $b1$ is the channel number of high input at side 1, $c1$ is the channel number of switch signal input at side 1.

NSi8221/ NSi8222:

$$I_{DD1} = 0.87 + 1.26 * b1 + 0.63 * c1 + VDD1 * f * C_L * c2 * 10^{-9}$$

$$I_{DD2} = 0.87 + 1.26 * b2 + 0.63 * c2 + VDD1 * f * C_L * c1 * 10^{-9}$$

When $b1$ is the channel number of high input at side 1, $c1$ is the channel number of switch signal input at side 1, $b2$ is the channel number of high input at side 2, $c2$ is the channel number of switch signal input at side 2.
